

Surface Area of a Triangular Prism

This tent is made of canvas, including a canvas floor. How do the manufacturers determine the area of canvas needed to make the tent?

Example 1: Find Surface Area

Find the surface area of the triangular prism.

$$\begin{aligned}
 A_{\Delta_s} &= \frac{1}{2} \times b \times h \\
 &= \frac{1}{2} \times 6.6 \times 3 \\
 &= 9.9 \text{ cm}^2
 \end{aligned}$$

$$\begin{aligned}
 \Rightarrow 2 \Delta_s &= 2(9.9) \\
 &= 19.8 \text{ cm}^2
 \end{aligned}$$

$$\begin{aligned}
 A_D &= 6.6 \times 2 \\
 &= 13.2 \text{ cm}^2
 \end{aligned}$$

$$\begin{aligned}
 A_E &= 5 \times 2 \\
 &= 10 \text{ cm}^2
 \end{aligned}$$

$$\begin{aligned}
 A_F &= 4 \times 2 \\
 &= 8 \text{ cm}^2
 \end{aligned}$$

$$\begin{aligned}
 \text{Total surface area} &= 19.8 + 13.2 + 10 + 8 \\
 &= 51 \text{ cm}^2
 \end{aligned}$$

Example 2: Use Surface Area and Convert Units

Gary has 2 m^2 of plywood and wants to make a small skateboard ramp. If he makes each right triangular face 1 m long and 40 cm high, how much plywood is left for the three rectangular faces?

$$\begin{aligned} \text{Convert } 40 \text{ cm} &\rightarrow \text{m} \\ &= 40 \div 100 \\ &= 0.4 \text{ m} \end{aligned}$$

$$\begin{aligned} \text{Area}_{\Delta} &= \frac{1}{2} \times b \times h \\ &= \frac{1}{2} \times 1 \times 0.4 \\ &= 0.2 \text{ m}^2 \\ \Rightarrow 2 \Delta s &= 2(0.2) \\ &= 0.4 \text{ m}^2 \end{aligned}$$

$$\text{Plywood} = \Delta s + \square s$$

$$2 = 0.4 + x$$

$$2 - 0.4 = x$$

$$1.6 = x$$

\Rightarrow Gary has 1.6 m^2 of plywood for the rectangular faces.

Key Ideas

- The surface area of a triangular prism is the sum of the areas of its faces.
- A triangular prism has two congruent triangular faces and three rectangular faces. The two triangular faces are often called the bases, even though they may not be horizontal.
